
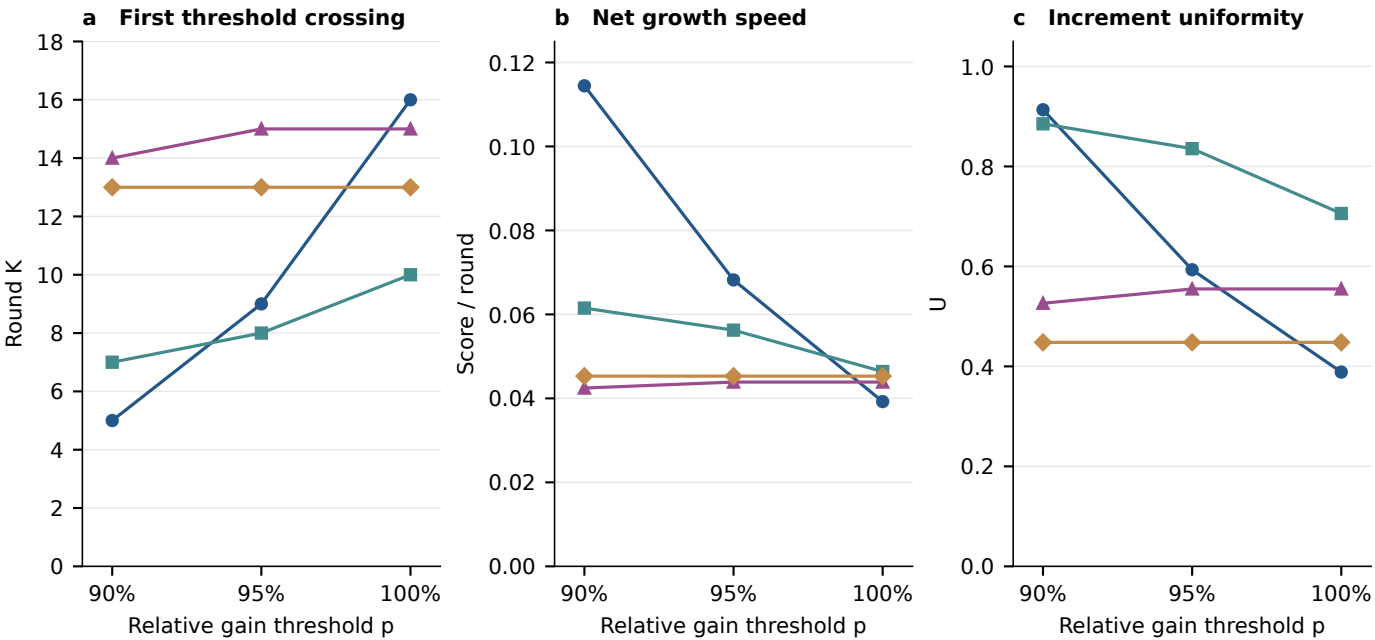
Default: mean score; K0 baseline; 90% of each model's own observed gain to K17.
U = 1 for equal positive increments; one isolated jump gives U = 1 / number of intervals.
K0 and Harness protocols differ; first-success stopping carries observations forward. Sonnet is incomplete.



Score curve, K0 baseline. Astra's late fluctuations reduce U at the exact observed peak (100%).
The conclusion about more uniform early growth is window-dependent, not a whole-trajectory label.
